

MRP Methodology, Tables and Figures

Prepared for YouGov on 10 December 2019 by

- Benjamin Lauderdale (University College London)
- Jack Blumenau (University College London)

This report summarises the current electoral situation in the United Kingdom in advance of the general election that is due to be held on 12 December 2019. The estimates provided here are based on updated versions of the modelling techniques that we used in the YouGov 2017 UK General Election Model, which correctly predicted the hung parliament and 93% of individual seats. This approach allows us to not just calculate national vote shares, but also to use demographic, geographic and political patterns in support for different parties across the UK to assess their relative performance in each parliamentary constituency.

METHODS

Data Collection

A sample of 14838 politically and demographically representative respondents was taken covering the entire UK (excluding Northern Ireland). An additional top-up sample of 90774 respondents was taken from across the YouGov panel. All the analyses below use both samples combined, but adjusting the latter data to match the national levels of the former. The period of data collection used in this report was 2019-12-04 to 2019-12-10. We have an average of 167 observations for the average constituency.

Model

There are not enough observations in individual constituencies to treat the data as separate constituency polls, but we can look for patterns in responses across constituencies that have similar characteristics, and then work out the implications of those patterns for each constituency. This strategy of “multilevel regression and post-stratification” or *MRP* is the same approach we used in the 2017 YouGov election model that correctly predicted the hung parliament and 93% of individual constituency winners.

Our modelling approach proceeds in two steps. First, we build a detailed description of which kinds of people live where in the UK. This “population model” tells us how many people we think voted in different ways in recent elections, are of each age, gender, level of educational qualifications, etc, and all the combinations of these, in each UK parliamentary constituency. The population model is constructed from a number of sources, including past election results, a variety of types of survey data and UK census data.

Second, we use the YouGov survey data described above to build a *survey response model* of current voting intention (or of responses to any of the questions listed below). This is a model of how voting intention is associated with the individual level characteristics that are in our description of the population plus characteristics of parliamentary constituencies. The survey data might indicate that people with different educational qualifications are giving different patterns of responses, or that different parts of the UK are giving different responses, or other similar patterns. The model describes all of these patterns, and allows us to make predictions about how individuals with any combination of characteristics would respond to the survey question.

Once we have these two things, we can systematically go through all the types of people that our population model says exist and use the survey response model to predict vote intention (or any other survey measure) for individuals of each type. For example, our population model tells us that there are some number of women who are 31-35 year-old, with a university degree, who voted Remain in 2016 and Liberal Democrat in 2017, and who live in the Twickenham constituency in London. Our survey response model then gives us a prediction of their survey response (whether vote intention or something else). We can then tally up these predictions for all the individuals that our population model says exist in the UK population, which gives us an estimate for the UK as a whole. Alternatively, we can tally up those predictions for each constituency separately, yielding estimates for every constituency, or by any other characteristic that we have used in the population model (age, gender, qualifications, etc). The survey response model captures the demographic patterns in how people are responding, and then this “post-stratification” step works out the implications given the variable demographic composition of different places (or groups) in the UK.

The models we have developed for this project look for patterns as a function of a number of variables, including individual 2017 vote, referendum vote, sex, age, qualifications, housing tenure, marital status and ethnicity. At the level of constituencies, we look for patterns as a function of the electoral history of the constituency, EU referendum vote, region/country, and several other variables. We also use interactions of these that ensure we are sensitive to local political context. For example, at the 2017 election, young Remain-voting 2015 Conservative voters were more likely to defect to Labour in seats where Labour was stronger and to the Liberal Democrats in seats where the Liberal Democrats were stronger.

Turnout Assumptions

In contrast to traditional polling approaches, we do not rely on respondents' self-reported likelihood of voting when working out probable voting patterns across different constituencies. Instead, we build a model based on data from past elections to predict whether different types of individual would be likely to vote in a new election. The result of this process is that we assume that the electorate for a new election would be demographically similar to the electorates of 2015 and 2017 ([which were themselves similar, despite 2017 claims about a "youthquake"](#)). This is the same strategy we used for the 2017 election model. It is not perfect, as it is possible that there will be changes to the demographic make-up of the electorate, but [is also unlikely to yield large errors overall](#).

Survey Questions

The question polled was:

There will be a UK general election on 12 December 2019. The candidates that will stand in your constituency, <CONSTITUENCY NAME>, are not yet known for certain. You may face a choice between the following parties and candidates.

Given these parties and candidates, how do you intend to vote in the upcoming election?

1. Conservative – <CANDIDATE NAME>
2. Labour – <CANDIDATE NAME>
3. Liberal Democrat – <CANDIDATE NAME>
4. Brexit Party – <CANDIDATE NAME>
5. Scottish National Party (SNP) – <CANDIDATE NAME>
6. Plaid Cymru – <CANDIDATE NAME>
7. Green – <CANDIDATE NAME>
8. Independent – <CANDIDATE NAME>
9. Other
10. Will Not vote
11. Don't know

Parties are not listed where they are not standing candidates. The “Other” option was only listed where there were additional candidates not already listed. Only high profile independent candidates were listed. These include all current MPs standing as independents as well as selected others like Claire Wright in East Devon and Jason Zadrozny in Ashfield.

Uncertainty

We do not report explicit intervals of uncertainty around all of the estimates that we provide below because it makes the tables extremely cumbersome to read. It is also important to note that we can only quantify some of the uncertainty that a reader *ought* to have about what the results tell us about what voters actually would do in an electoral situation that resembles that described by the question. The traditional statistical margin of error only includes uncertainty that results from having a limited sample of a population. We provide this for some of the estimates that most closely resemble the current electoral situation. However, as explained above, the estimates presented below are based on multiple models (a population model, a survey response model, a turnout model), and it is very difficult to fully quantify the potential sources of uncertainty that arise in all of these models.

We do not expect to get every seat right, there are too many seats that are very close between two (or more) parties. Given the stated level of uncertainty in our estimates, our best guess is that we will predict 93% of individual seats correctly, with a most likely range of 91% to 95%. Any variation in that range can be ascribed to luck in how individual marginal seats

fall relative to our predictions. If we do worse than that range, it would mean that we were not merely unlucky, but that there were more serious biases in our modelling. If we do better than that range, it would mean that we were not merely lucky, but also underconfident in the quality of our modelling.

THE CURRENT ELECTORAL SITUATION

National Vote and Seat Estimates

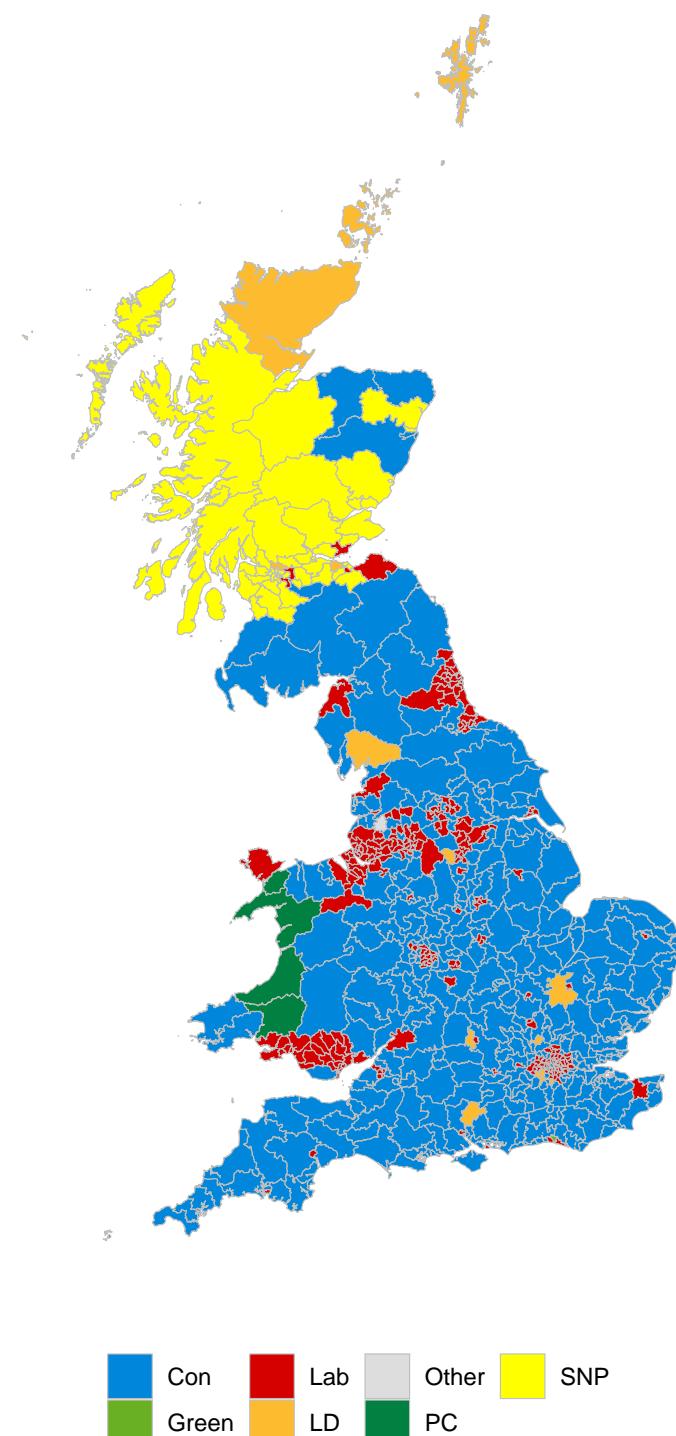

Table 1: Current estimated seat counts

	2017 Result	Estimate	Interval
Con	317	339	[311 - 367]

FIGURES

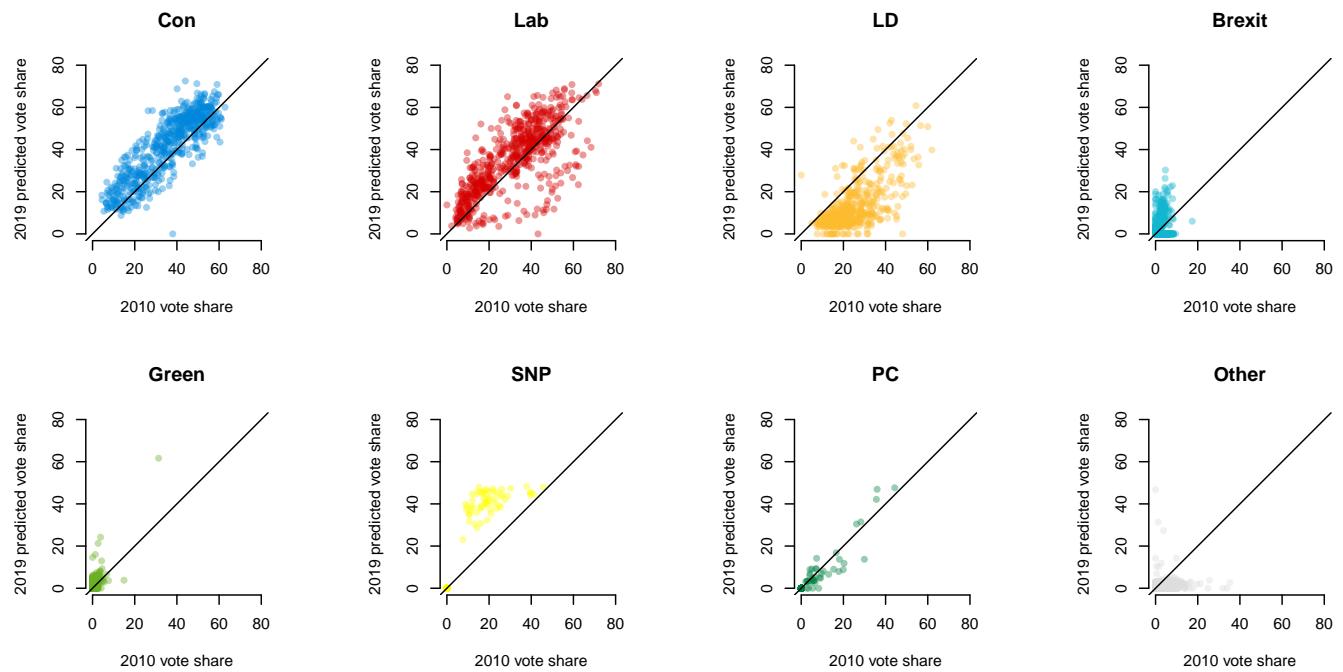

Constituency Vote Share by 2017 Constituency Vote Share

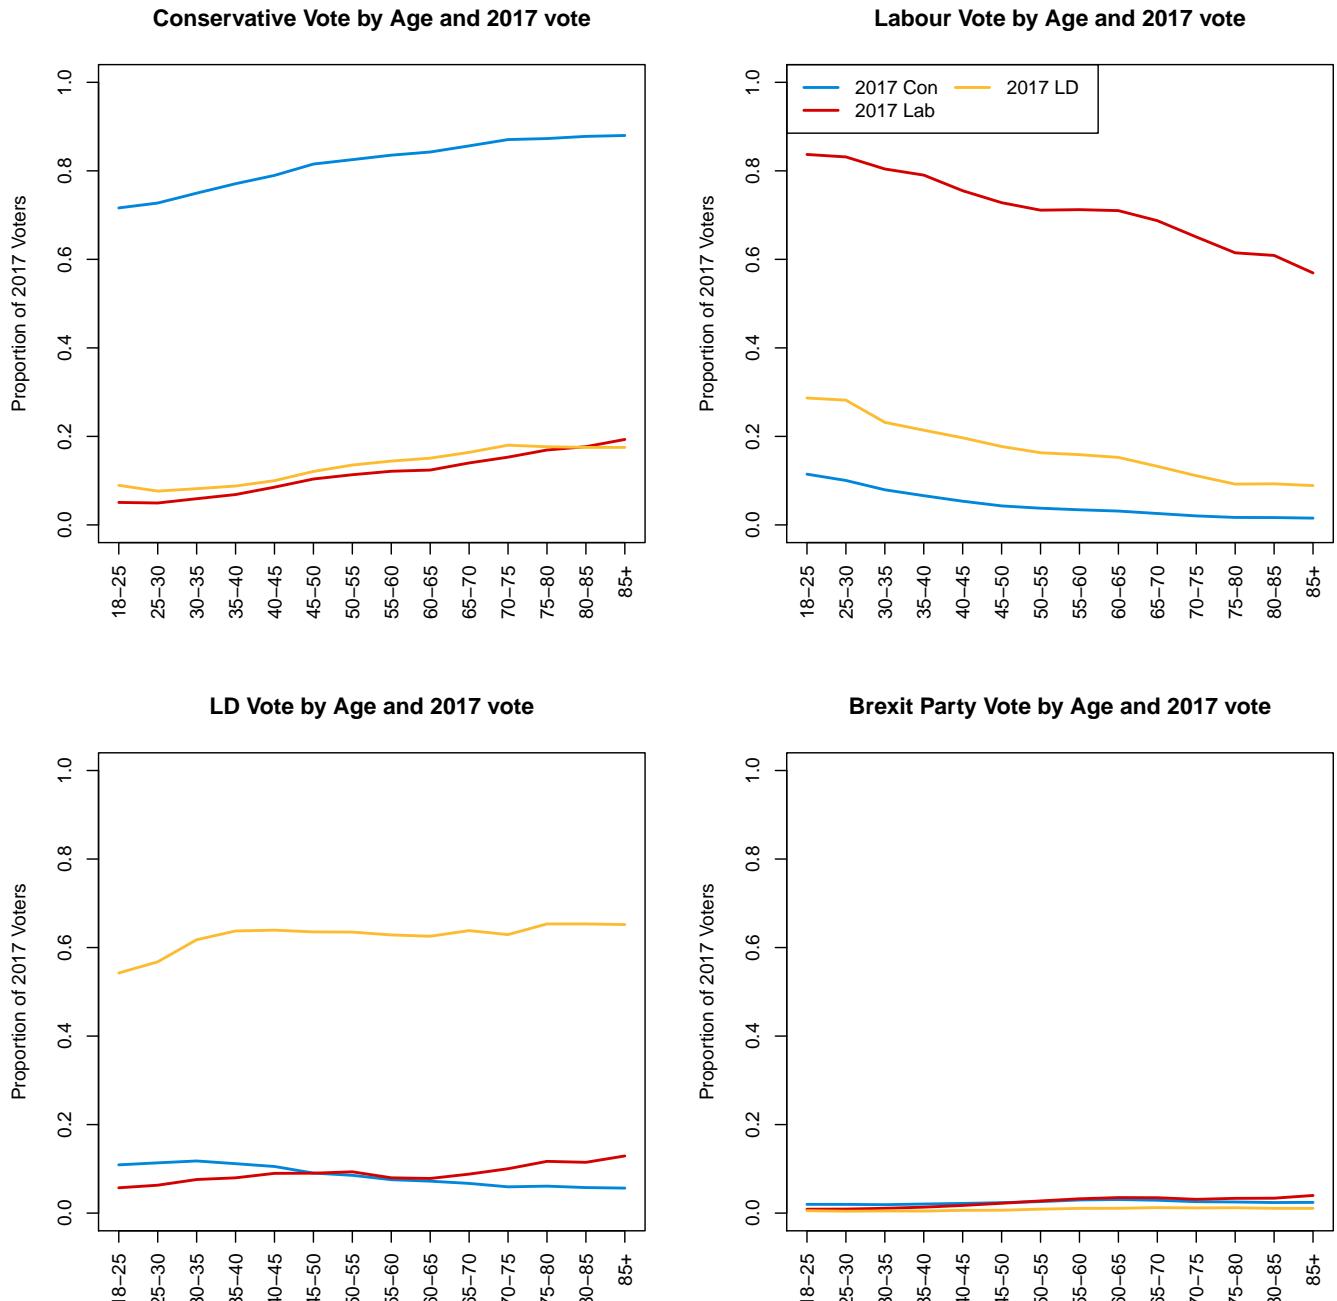

Constituency Vote Share by 2015 Constituency Vote Share

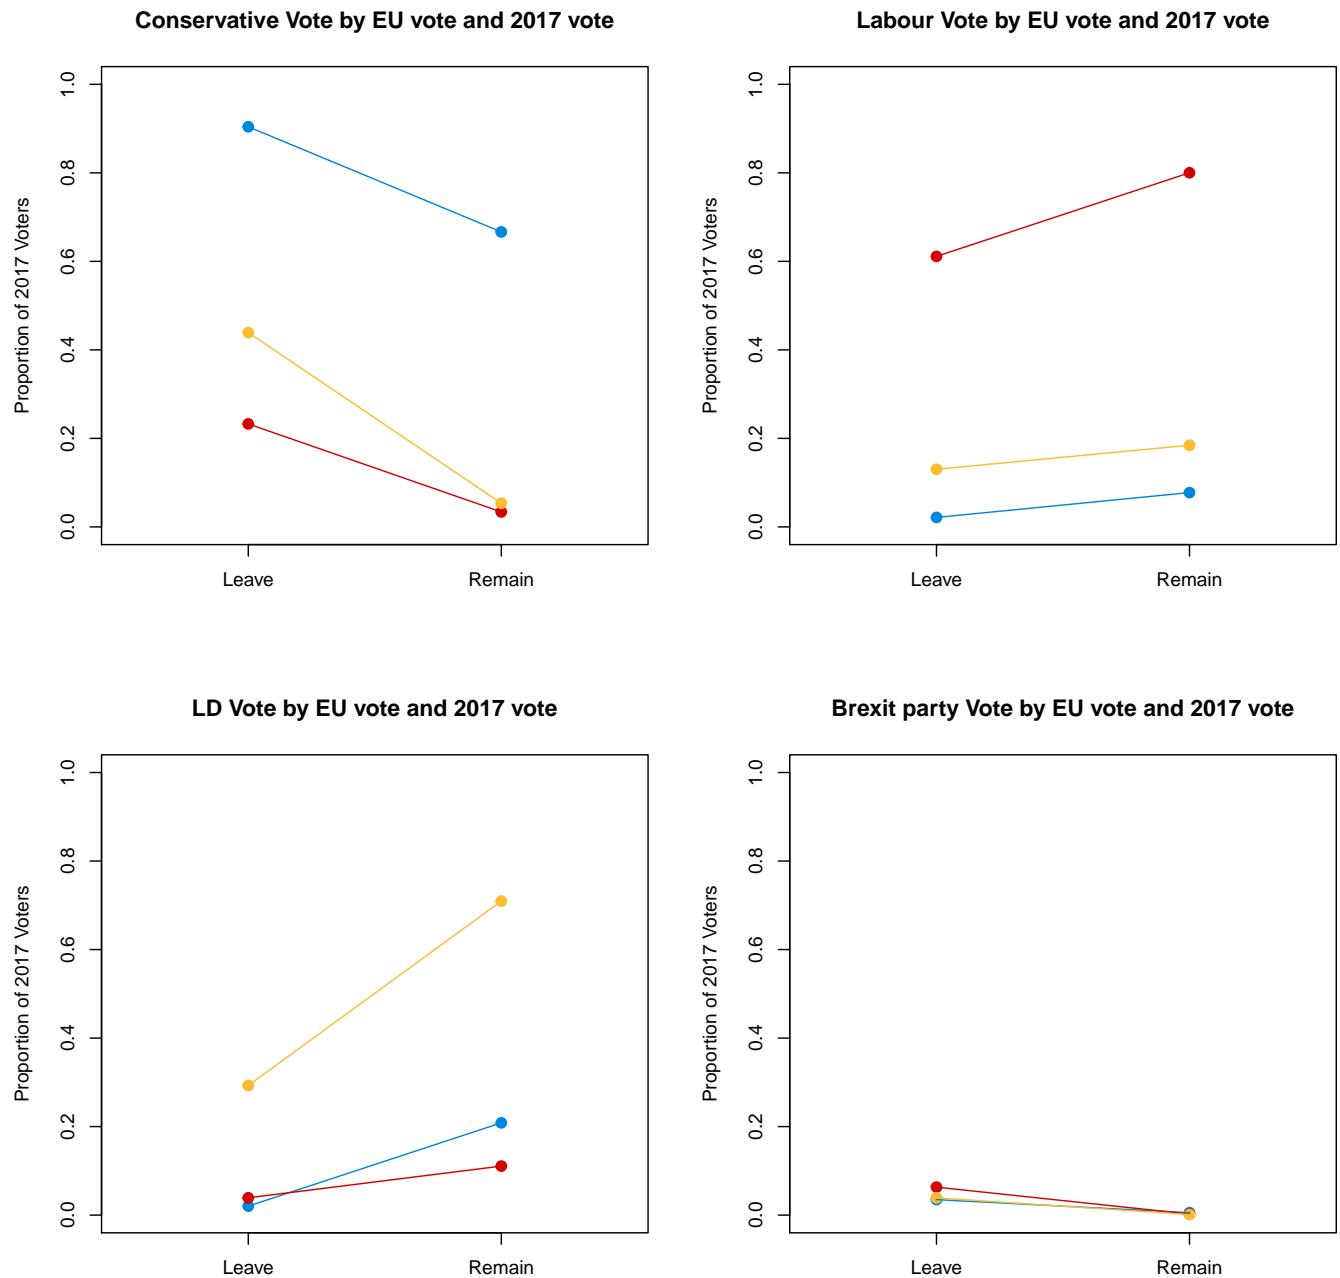

Constituency Vote Share by 2010 Constituency Vote Share

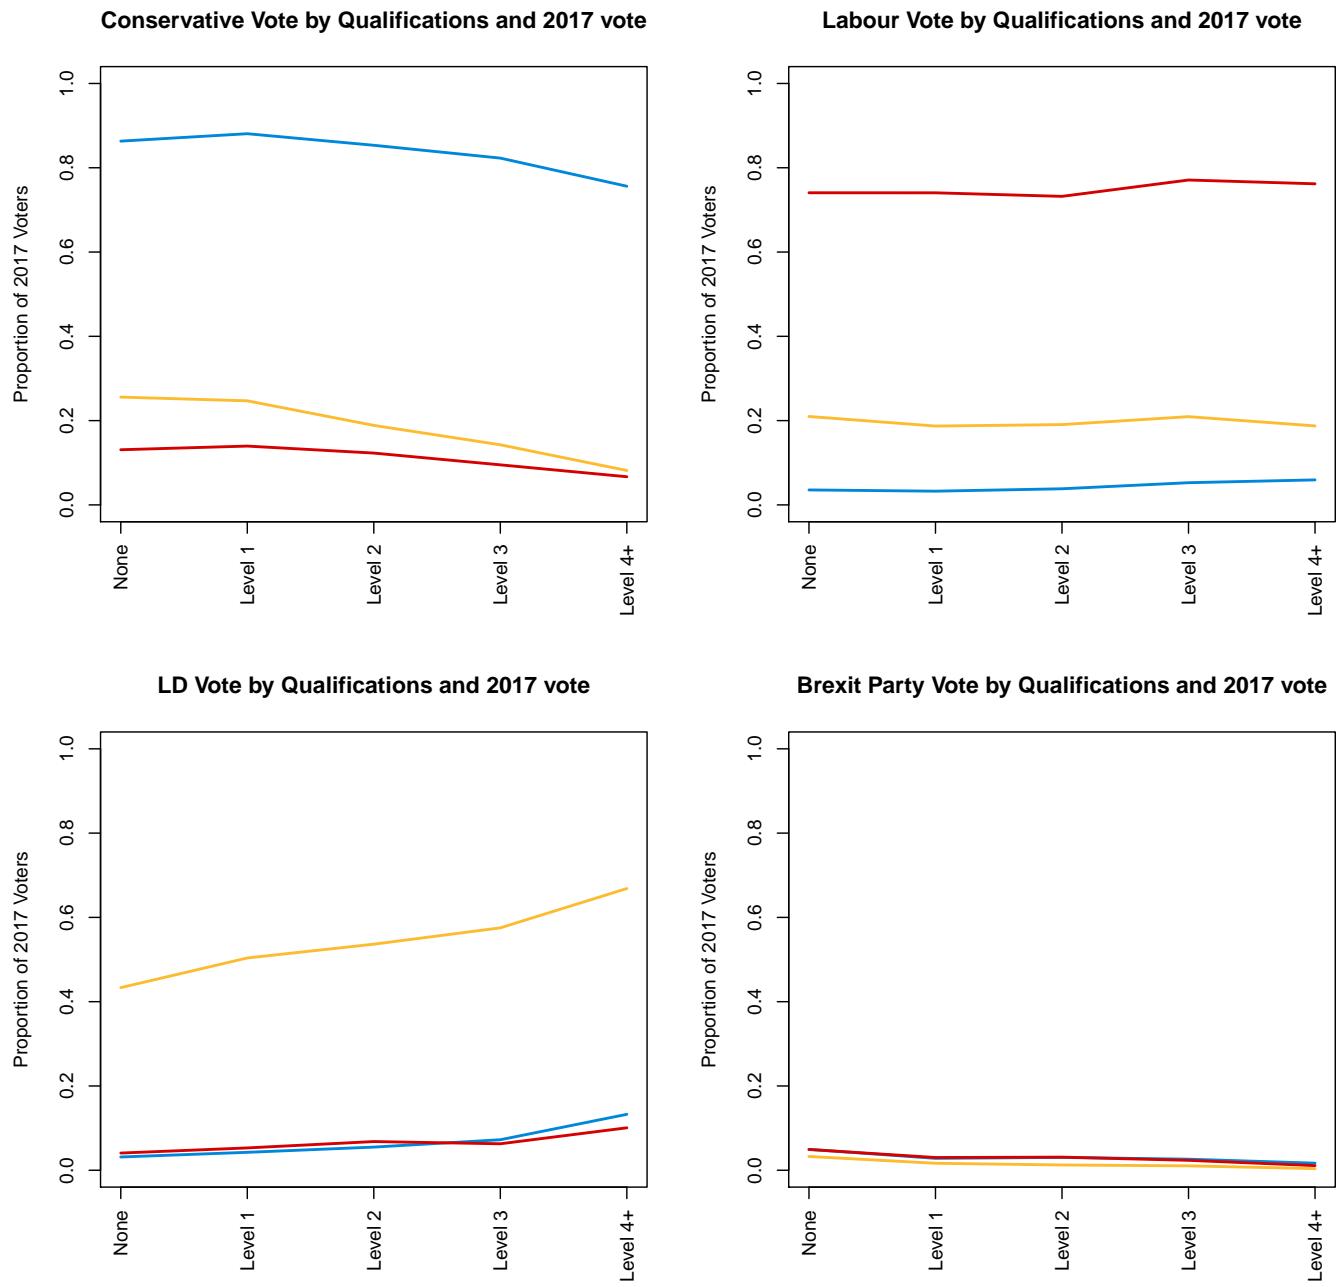

Vote by age and 2017 vote

Vote by referendum vote and 2017 vote

Vote by qualifications and 2017 vote

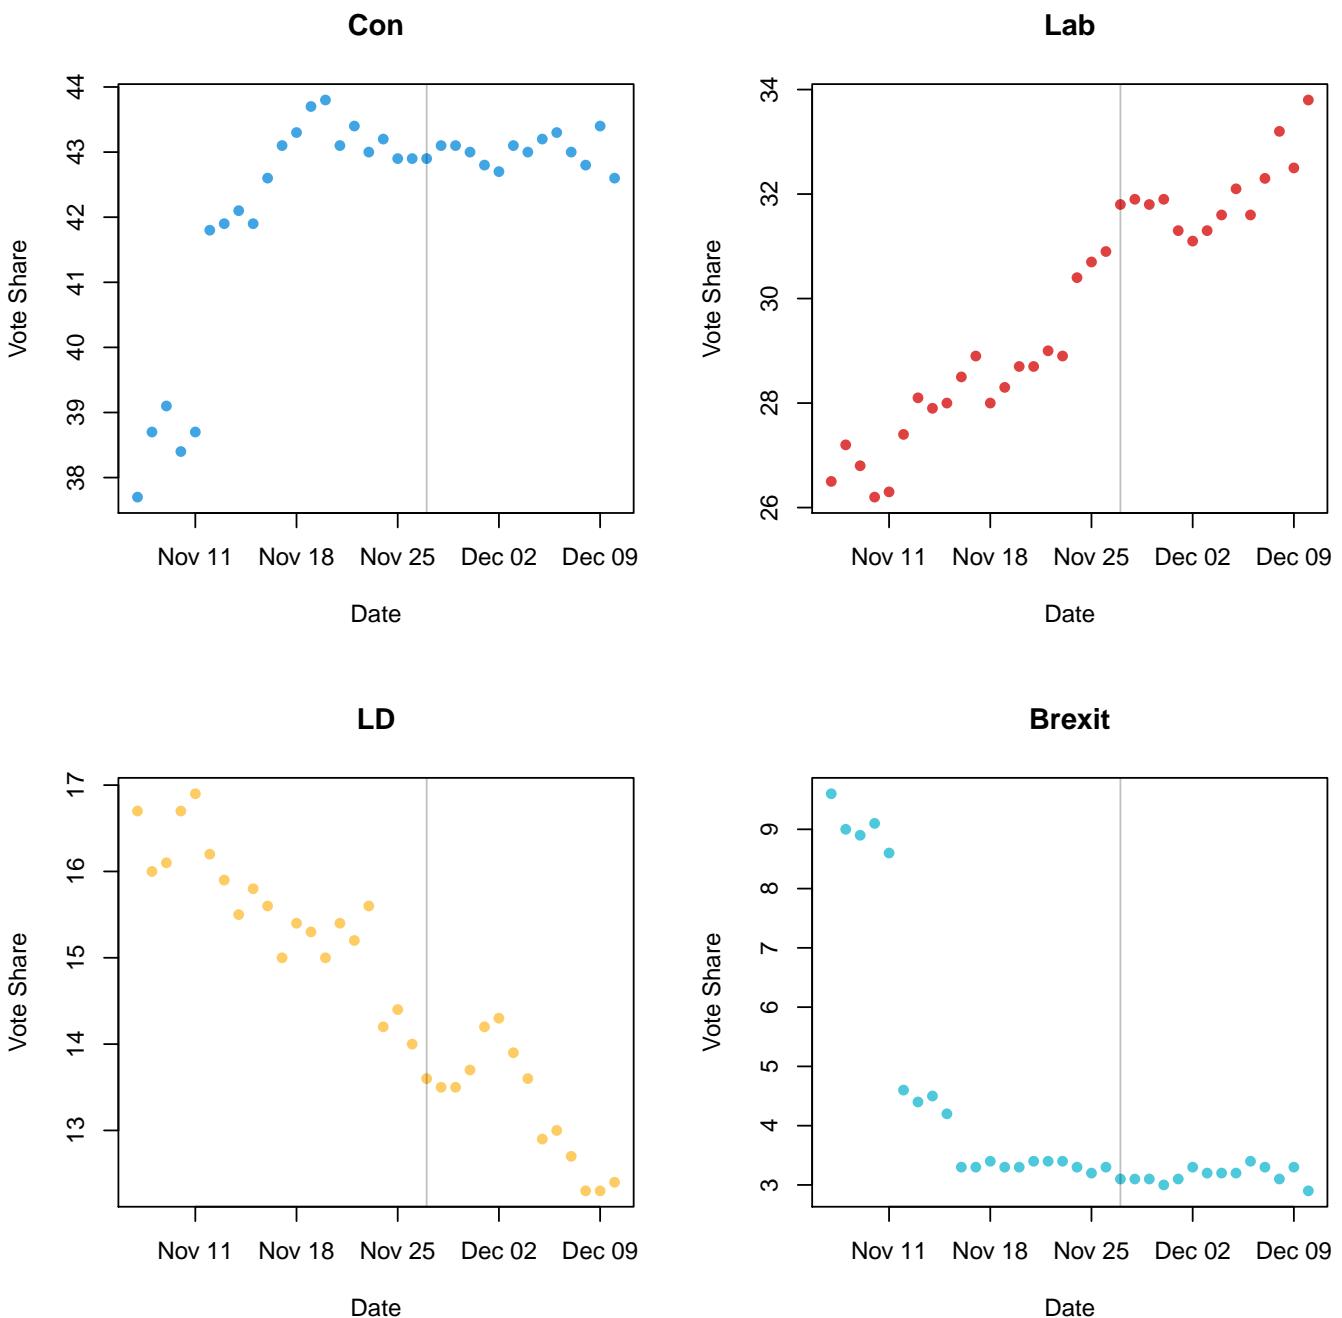

Note: the “Does not apply” and “Other” categories are excluded from this plot. “Does not apply” includes all voters over age 70, regardless of their actual level of qualifications. This is because the Annual Population Survey does not record qualifications for retired individuals past the age of 70. “Other” includes qualifications that are not included on the Register of Regulated Qualifications.

THE CAMPAIGN

The plots on this page and the next page show the evolution of our estimates from the beginning of the campaign. The vertical lines show the dates on which our estimates were publicly released. Note that the model was almost entirely unchanged during this period, with a few minor exceptions. First, the candidates/parties believed to be standing in each constituency were not fixed during the early period of the campaign. Second, variables based on tactical voting advice websites changed during the campaign.
